

Seu terminal agora tem copiloto.

Com o GitHub
Copilot CLI,
você pode fazer
mais sem mudar
de janela.

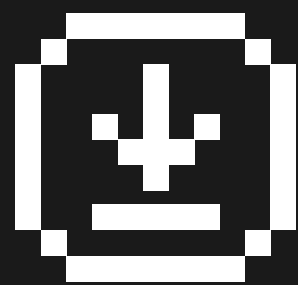

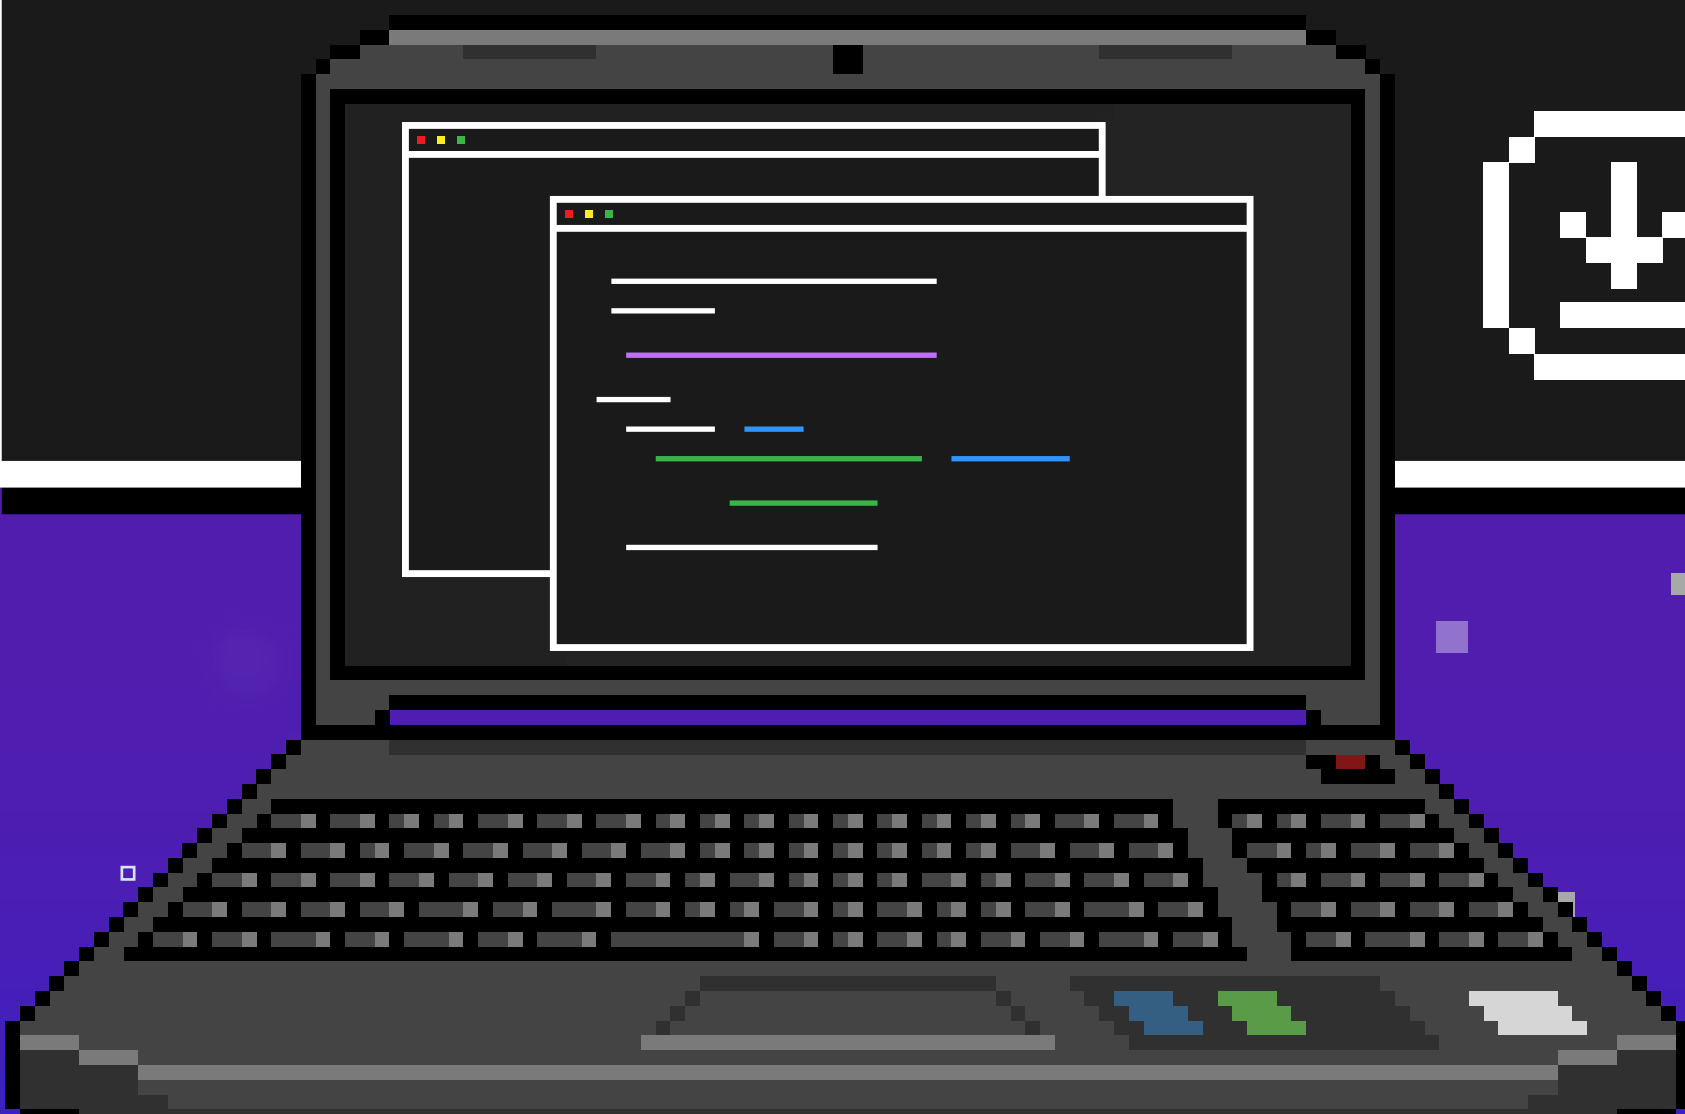

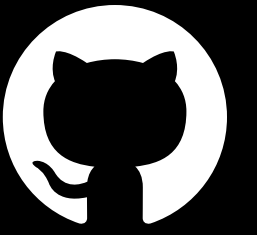

1) Instale e comece

```
npm install -g @github/copilot  
copilot  
/login
```

O **Copilot CLI** se conecta à sua conta e já está pronto para ajudar.

2) Peça ajuda a partir da terminal

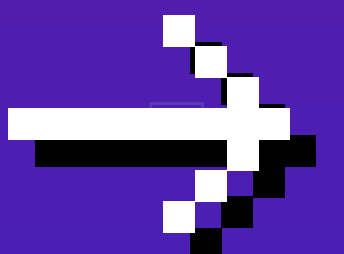

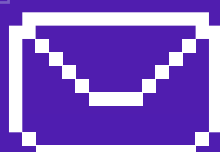

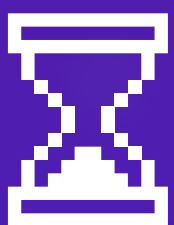

“Mostre a estrutura do projeto.”

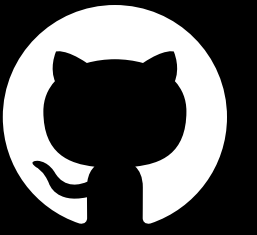

“Certifique-se de que meu ambiente esteja pronto.”

“Encontre issues para principiantes.”

O **Copilot CLI** resolve isso e mantém você no comando.

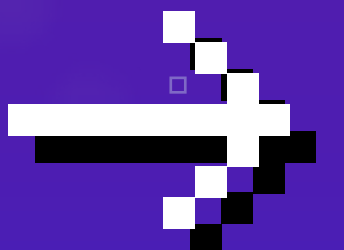

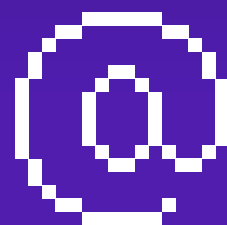

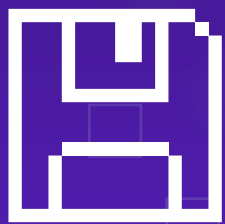

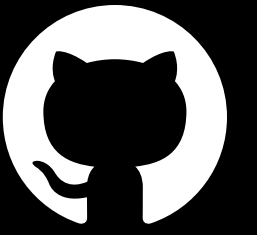

3) Implemente sem perder o controle

“Comece o issue #1234 e me mostre o diff.”

O **Copilot CLI** redige, sugere e confirma antes de executar.

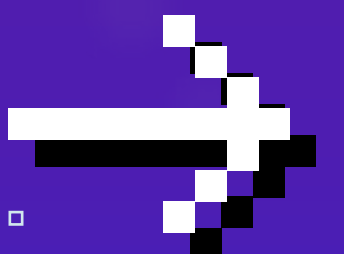

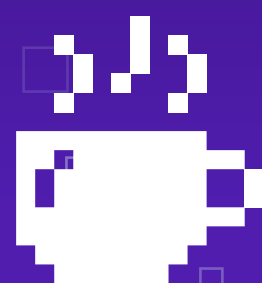

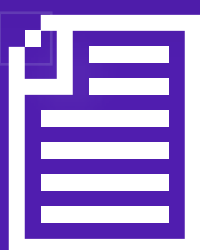

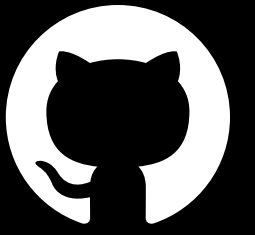

4) Feche o ciclo

“Faça commit, referencie #1234 e abra um draft PR.”

O **Copilot CLI** automatiza os passos tediosos, você se concentra no código.

O Copilot CLI não substitui seu IDE.

Ele apenas acompanha você onde já trabalha: na terminal.

Menos interrupções, mais produtividade.
